Task 1: Determine the Health of the Project

- **Assess the project status**: Review the progress, backlog, and team morale. Identify signs of delays, missed deadlines, or unaddressed issues.
- **Identify key indicators**: Look for common problems such as:
  - Incomplete tasks
  - Roadblocks or dependencies causing delays
  - Lack of communication between team members
  - Misalignment between team goals and project objectives
- **Document health status**: Summarize the project's health as either "healthy," "at risk," or "in crisis" based on the findings. Provide reasons for your assessment.

Task 2: Determine Actions You Will Take as the Scrum Master

- **Address issues found in Task 1**: If the project is at risk or in crisis, list specific actions you'll take to resolve the issues.
  - **Improve communication**: Facilitate better communication among team members through daily stand-ups or focused meetings.
  - **Remove impediments**: Actively work to eliminate roadblocks, whether they are technical, logistical, or organizational.
  - **Engage stakeholders**: Reassess the involvement of stakeholders and ensure their expectations align with team progress.
  - **Reinforce Agile practices**: Ensure the team adheres to Scrum values like transparency, adaptability, and teamwork.

Task 3: Perform a Retrospective and Suggest a Big Change

- **Conduct a Retrospective**: Reflect on what went well and what didn't over the last sprint or project phase. Use the "What went well, What didn't go well, and What can be improved" format.
  - **Celebrate successes**: Highlight aspects that the team did well, whether it's collaboration or hitting milestones.
  - **Identify pain points**: Look at the challenges, including bottlenecks, lack of resources, or process inefficiencies.
- **Suggest a big change**: Based on the retrospective, propose one significant improvement for the future:
  - **Example suggestions**:
    - Implement better backlog refinement sessions.
    - Introduce more frequent feedback loops to ensure alignment with the product vision.
    - Change how sprints are planned to account for unexpected dependencies or risks.

By systematically addressing each of these tasks, you'll be able to showcase your ability to diagnose issues, take action as a Scrum Master, and drive continuous improvement in the team's processes.
